

### ABSTRACT OF THE DISCLOSURE

5 A device for connecting an electrical load to an insulated power supply  
cable, comprising conducting elements that can be electrically coupled to an  
electrical conductor of an insulated cable and form at least one contact for  
connection to a connector for an electrical load; the conducting elements are  
accommodated within an outer enclosure made of electrically insulating  
material constituted by shells that can be fastened together. The device  
10 further comprises safety elements that are adapted to prevent the connector  
from being recoupled to the contact once uncoupling has been performed  
inside the outer enclosure.
